

**DATA TRANSMISSION ANALYZER**  
**MD6420A**

*For Evaluating Quality of Digital Data Networks*

**GPIB  
OPTION**

Bit error rate measurement is the most critical parameter in evaluating the quality of digital transmission modes. However, conventional methods, which measure only average bit error rates, are inadequate. In the MD6420A, various types of extension and remote control units are provided as options, as well as units which allow the use of various types of interfaces.

The measuring conditions can be stored in memory and recalled prior to measurement with the touch of a single key. An error analysis function allows histograms of either error or alarm data to be quickly and easily displayed. In addition, the analyzer is portable so that it can be used on site for maintenance operations.

**Features**

- Can measure a variety of devices from low-speed modems to high-speed digital lines

Can be configured to a variety of communications protocols via ITU-T V, X, G, and I series by using plug-in units. Can perform high-quality evaluations of data communications systems that have bit rates from 50 b/s to 10 Mb/s.

- Simultaneous error measurement of various error parameters

The error count (bit error, parity error, and CRC error, etc.) error rate, block error count, block error rate, US, %US, SES, %SES, DM, %DM, ES, %ES, EFS, %EFS, AT, %AT, BBER, clock slip, and synchronization loss can be measured, Alarm states such as AIS can be continuously monitored\*.

\*: Conforms to ITU-T G.821

- Data will not be lost if a power failure occurs during measurement

If an AC power failure occurs during error rate measurements, all data obtained prior to the failure is recalled from memory and the measurement is automatically continued when the power is resupplied. When the power returns, the time at which power failure occurred is displayed on the EL display.

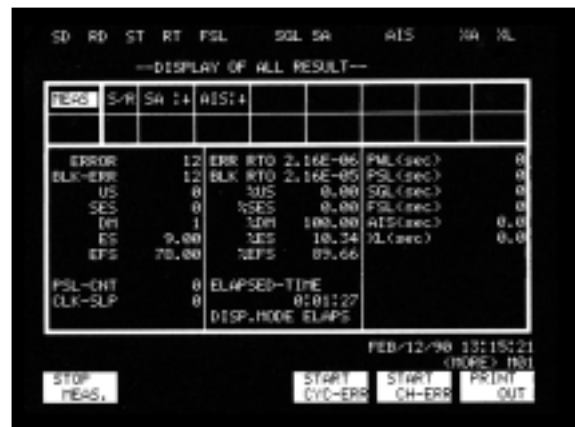

- Storage and statistical analysis of error measurement data

When a error analysis unit is used, the error measurement data can be stored in the unit. The results of stored data analyses can be displayed as a histogram.

**Example of display screen**

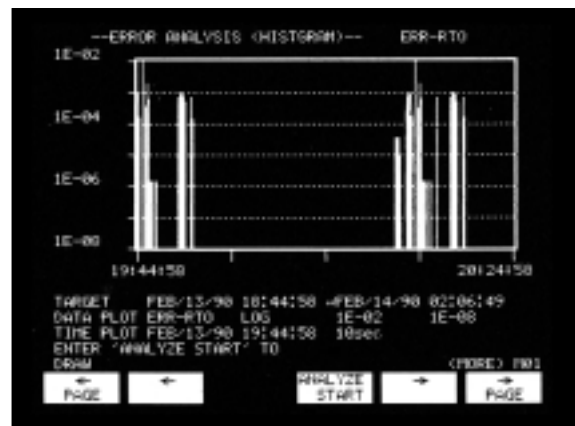

- Overall display of error measurements

Up to 22 measurement items can be monitored simultaneously. If a power failure occurs during measurements then measurements will be continued from the time at which the power is resupplied. The failure time (PWL) will be displayed when power is resupplied.

- Histogram screen

The number of errors and the rates of which errors occurred can be displayed relative to the time of measurement. The parameters which are to be displayed on the horizontal and vertical axes can be selected by the user.

## Combinations of interface and extension units

The MD6420A can be combined with many plug-in units to perform a variety of measurement.
